

MEDTRACK: AWS Cloud-Enabled Healthcare Management System

Project Description:

In today's fast-evolving healthcare landscape, efficient communication and coordination between doctors and patients are crucial. Med Track is a cloud-based healthcare management system that streamlines patient doctor interactions by providing a centralized platform for booking appointments, managing medical histories, and enabling diagnosis submissions. To address these challenges, the project utilizes Flask for backend development, AWS EC2 for hosting, and DynamoDB for managing data. Med-track allows patients to register, log in, book appointments, and submit diagnosis reports online. The system ensures real-time notifications, enhancing communication between doctors and patients regarding appointments and medical submissions. Additionally, AWS Identity and Access Management (IAM) is employed to ensure secure access control to AWS resources, allowing only authorized users to access sensitive data. This cloud-based solution improves accessibility and efficiency in healthcare services for all users..

Scenario 1: Efficient Appointment Booking System for Patients

In the MEDTRACK system, AWS EC2 provides a reliable infrastructure to manage multiple patients accessing the platform simultaneously. For example, a patient can log in, navigate to the appointment booking page, and easily submit a request for an appointment. Flask handles backend operations, efficiently retrieving and processing user data in real-time. The cloud-based architecture allows the platform to handle a high volume of appointment requests during peak periods, ensuring smooth operation without delays.

Scenario 2: Secure User Management with IAM

The MEDTRACK system provides doctors and patients with easy access to medical histories and relevant resources. For example, a doctor logs in to view a patient's medical history and upcoming appointments. They can quickly access, and update records as needed. Flask manages real-time data fetching from DynamoDB, while EC2 hosting ensures the platform performs seamlessly even when multiple users access it simultaneously, offering a smooth and uninterrupted user experience.

Scenario 3: Easy Access to Medical History and Resources

MEDTRACK features a dynamic user dashboard that displays all past and upcoming bookings for the logged-in user. For example, a user who has booked a flight and a hotel can view these bookings categorized by type, along with dates, price, and cancellation options. Flask fetches this data from AWS DynamoDB, which persistently stores all user bookings. The dashboard UI, powered by responsive HTML/CSS and Flask templates, ensures users can review or manage bookings anytime, from any device, with real-time updates and quick cancellation workflows.

AWS ARCHITECTURE

Entity Relationship (ER)Diagram:

Pre-requisites:

1. **.AWS Account Setup:** [AWS Account Setup](#)
2. **Understanding IAM:** [IAM Overview](#)
3. **Amazon EC2 Basics:** [EC2 Tutorial](#)
4. **DynamoDB Basics:** [DynamoDB Introduction](#)
5. **SNS Overview:** [SNS Documentation](#)
6. **Git Version Control:** [Git Documentation](#)

Project WorkFlow:

1. AWS Account Setup and Login

Activity 1.1: Set up an AWS account if not already done.

Activity 1.2: Log in to the AWS Management Console

2. DynamoDB Database Creation and Setup

Activity 2.1: Create a DynamoDB Table.

Activity 2.2: Configure Attributes for travel-Users and Bookings Tables.

3. SNS Notification Setup

Activity 3.1: Create an SNS Topic named BookingConfirmation for sending notifications.

Activity 3.2: Subscribe email to the topic to receive booking and cancellation alerts.

4. Backend Development and Application Setup

Activity 4.1: Develop the Backend Using Flask.

Activity 4.2: Integrate AWS Services Using boto3.

5. IAM Role Setup

Activity 5.1: Create IAM Role

Activity 5.2: Attach Policies

6. EC2 Instance Setup

Activity 6.1: Launch an EC2 instance to host the Flask application.

Activity 6.2: Configure security groups for HTTP, and SSH access.

7. Deployment on EC2

Activity 7.1: Upload Flask

Files **Activity 7.2:** Run the

Flask App

8. Testing and Deployment

Activity 8.1: Conduct functional testing to verify user registration, login, book requests, and notifications.

Epic 1 : Web Application Development And Setup

● Activity 1.1: Develop Backend Using Flask.

The backend of the MEDTRACK system is developed using the Flask framework in Python. Flask is used to handle application routing, manage user requests, process appointment booking operations, and interact with AWS services such as DynamoDB and SNS. The backend also manages patient records, doctor information, and diagnosis submissions.

● Activity 1.2: Create Frontend Pages.

the frontend of the application is developed using HTML, CSS, and JavaScript to provide an interactive user interface. The system includes pages such as home page, login page, registration page, patient dashboard, doctor dashboard, appointment booking page, and diagnosis submission page. These pages allow users to interact with the system easily.

● Activity 1.3: Implement User Authentication

User authentication is implemented to allow patients and doctors to securely access the system. Users can register with their details and log in using their credentials. Passwords are securely stored and validated during login to ensure safe access to the healthcare management system.

Activity 1.4 – Configure Application Structure

The project follows a structured directory format. A templates folder is used to store HTML pages, while the static folder contains CSS and JavaScript files. The main backend logic is implemented in the app.py file. This structure ensures better organization and maintainability of the project.

Activity 1.5 – Test Web Application Locally

Before deploying the application to the cloud, the web application is tested locally. The Flask server is executed on the local machine to verify the functionality of user registration, login, appointment booking, and diagnosis submission. This ensures that the system works correctly before deployment.

Epic 2 : AWS Account Setup

● Activity 1.1: Set up an AWS account if not already done.

AWS account name

Choose a name for your account. You can change this name in your account settings after you sign up.

[Verify email address](#)

OR

[Sign in to an existing AWS account](#)

- **Activity 1.2: Log in to the AWS Management Console**

- After setting up your account, log in to the [AWS Management Console](#).

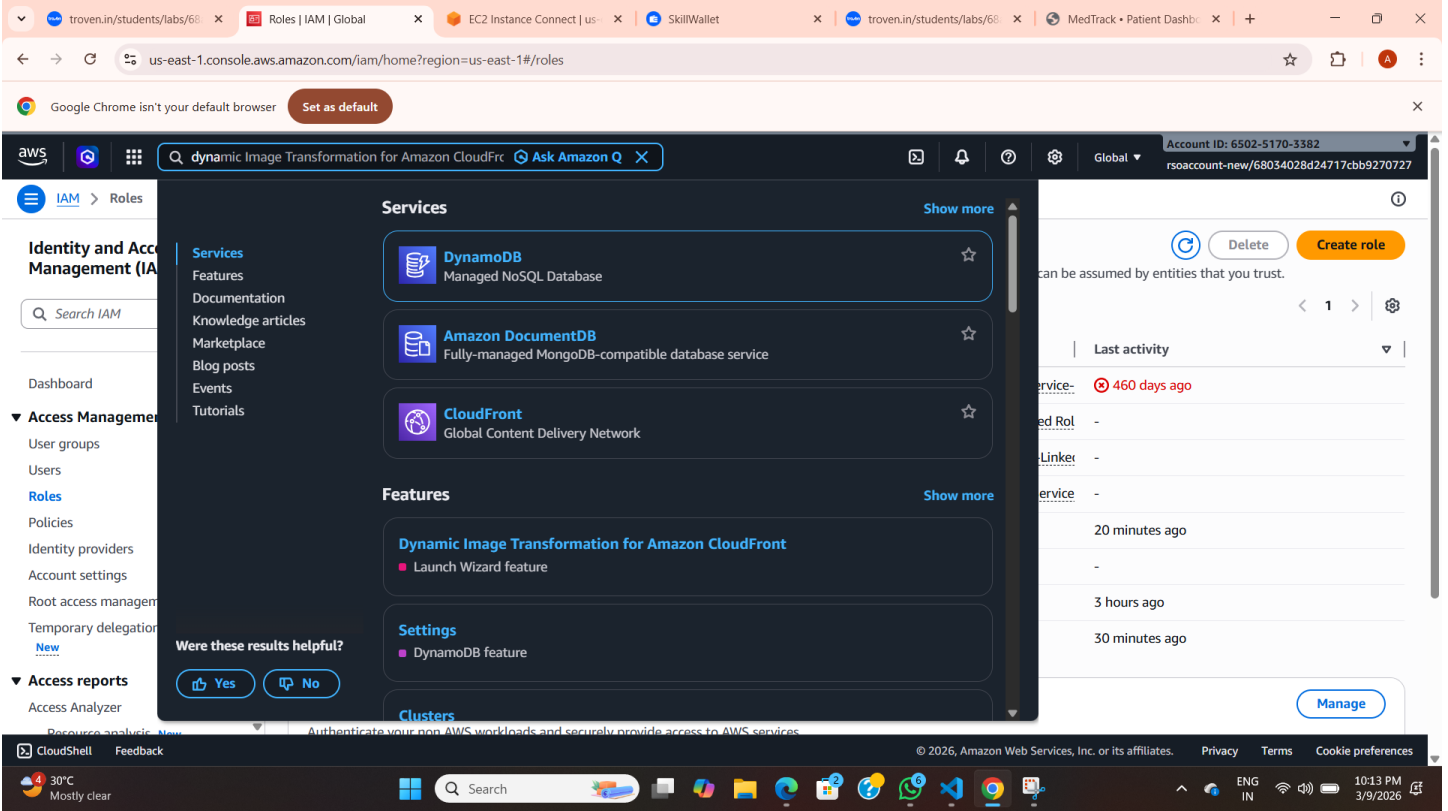

The screenshot shows the AWS Management Console sign-in page. At the top left is the AWS logo. Below it is the 'Sign in' heading. There are two radio button options: 'Root user' (selected) and 'IAM user'. The 'Root user' option includes the text 'Account owner that performs tasks requiring unrestricted access. [Learn more](#)'. The 'IAM user' option includes the text 'User within an account that performs daily tasks. [Learn more](#)'. Below these options is a text input field labeled 'Root user email address' containing the placeholder text 'username@example.com'. A blue 'Next' button is positioned below the email field. At the bottom left, there is a small disclaimer: 'By continuing, you agree to the [AWS Customer Agreement](#) or other agreement for AWS services, and the [Privacy Notice](#). This site uses essential cookies. See our [Cookie Notice](#) for more information.' On the right side of the page, there is a large purple and blue gradient box with the text 'AI Use Case Explorer' in large white font, followed by 'Discover AI use cases, customer success stories, and expert-curated implementation plans' in smaller white font. At the bottom of this box is a link 'Explore now >'.

Epic 3: DynamoDB Database Creation and Setup

Activity 3.1: Navigate to the DynamoDB

To store user and appointment data for the MEDTRACK system, Amazon DynamoDB is used as the database service. In the AWS Management Console, the DynamoDB service is searched and selected to begin database creation and management.

The screenshot shows the AWS IAM console interface. The search bar at the top contains the text "dynamic Image Transformation for Amazon CloudFront". The search results are displayed in a list format, showing the following items:

- Services**
 - DynamoDB**: Managed NoSQL Database
 - Amazon DocumentDB**: Fully-managed MongoDB-compatible database service
 - CloudFront**: Global Content Delivery Network
- Features**
 - Dynamic Image Transformation for Amazon CloudFront**
 - Launch Wizard feature
 - Settings**
 - DynamoDB feature

At the bottom of the search results, there is a feedback prompt: "Were these results helpful?" with "Yes" and "No" buttons. The right sidebar shows the "Create role" button and a "Last activity" section with a table of activity logs.

Service	Role	Linker	Service	Time
service-	460 days ago			
ed Rol	-			
Linker	-			
service	-			
	20 minutes ago			
	-			
	3 hours ago			
	30 minutes ago			

Activity 3.2 – Create DynamoDB Tables

Two DynamoDB tables are created to store the system data. The Users table stores user information such as patient and doctor details. The Appointments table stores appointment booking details including appointment ID, doctor ID, patient ID, date, and status. These tables allow the system to efficiently manage healthcare records.

Epic 4: SNS Notification Setup

Activity 4.1 – Create SNS Topic for Sending Email Notifications

Amazon Simple Notification Service (SNS) is used in the MedTrack system to send notifications to users. An SNS topic is created in the AWS console to manage email notifications. This topic allows the system to send automated notifications when important actions occur such as appointment booking or diagnosis updates.

Activity 4.2 – Subscribe Users and Admin to SNS Topic

After creating the SNS topic, email addresses of users and administrators are subscribed to the topic. Once subscribed, they will receive notifications whenever the system publishes a message to the SNS topic. This helps keep both patients and administrators informed about system activities.

30°C Mostly clear 10:14 PM 3/9/2026

Epic 5: IAM Role Setup

Activity 5.1 – Create IAM Role

AWS Identity and Access Management (IAM) is used to control access to AWS resources. An IAM role is created in the AWS Management Console to allow the EC2 instance to interact with other AWS services such as DynamoDB and SNS. This role ensures secure access and proper permissions for the application to function correctly.

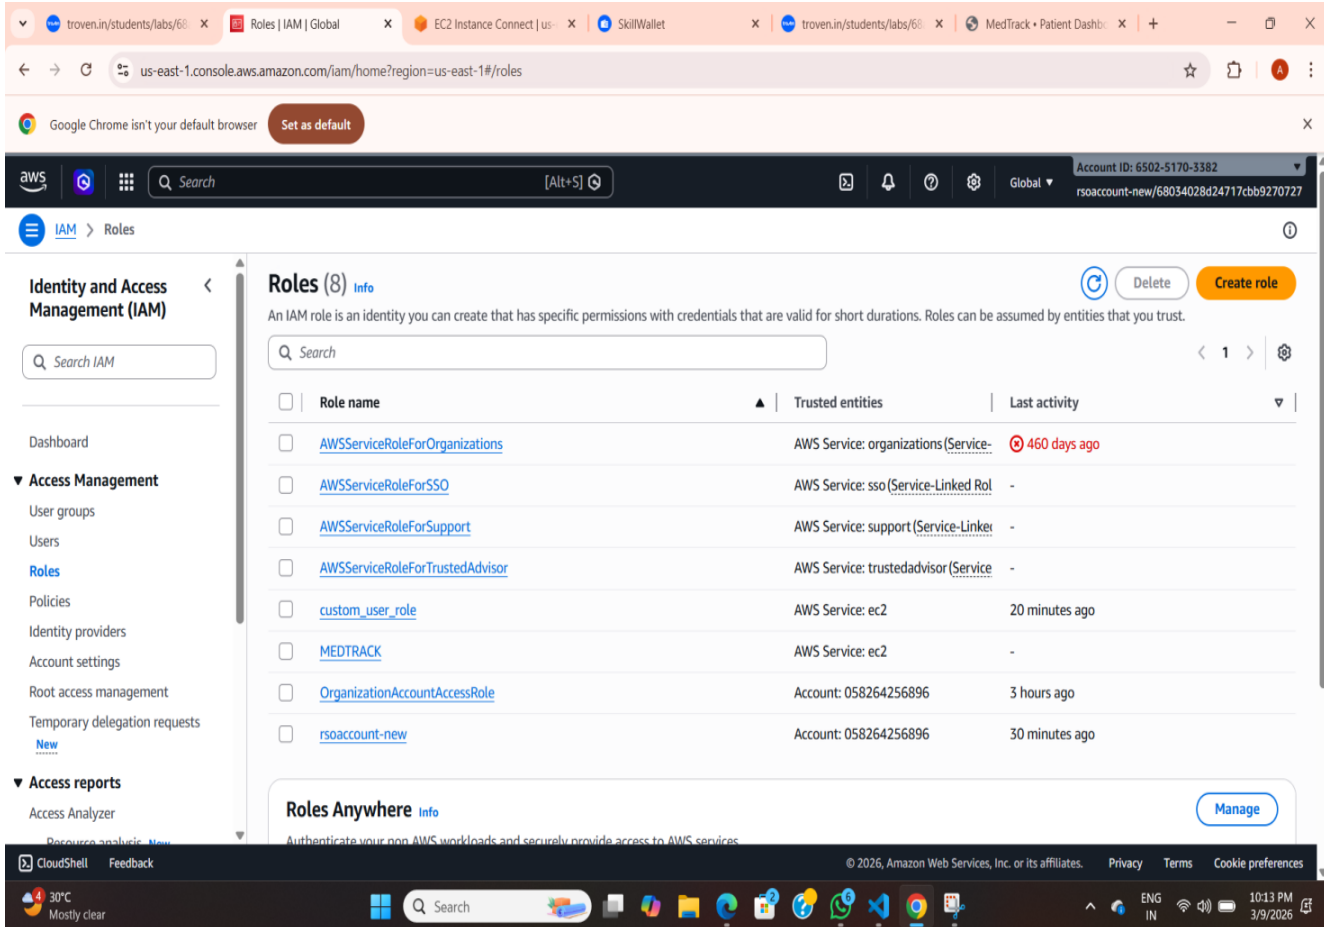

The screenshot displays the AWS IAM Dashboard in a web browser. The browser's address bar shows the URL `us-east-1.console.aws.amazon.com/iam/home?region=us-east-1#/home`. The AWS Management Console header includes the AWS logo, a search bar, and the account ID `6502-5170-3382`. The left sidebar shows the navigation menu with 'IAM' selected. The main content area is titled 'IAM Dashboard' and contains several sections:

- IAM resources:** A section titled 'Resources in this AWS Account' containing a red-bordered box with an error message: 'Access denied to iam:GetAccountSummary'. The message states: 'You don't have permission to `iam:GetAccountSummary`. To request access, copy the following text and send it to your AWS administrator. [Learn more about troubleshooting access denied errors.](#)' Below the message, the details are listed: 'User: `arn:aws:sts::650251703382:assumed-role/rsoaccount-new/68034028d24717cbb9270727`', 'Action: `iam:GetAccountSummary`', 'On resource(s): `*`', and 'Context: no identity-based policy allows the action'. A 'Diagnose with Amazon Q' button is at the bottom.
- AWS Account:** A section containing another red-bordered box with an error message: 'Access denied to iam:ListAccountAliases'. The message states: 'You don't have permission to `iam:ListAccountAliases`. To request access, copy the following text and send it to your AWS administrator. [Learn more about troubleshooting access denied errors.](#)' Below the message, the details are listed: 'User: `arn:aws:sts::650251703382:assumed-role/rsoaccount-new/68034028d24717cbb9270727`', 'Action: `iam:ListAccountAliases`', and 'On resource(s): `*`'. A 'Diagnose with Amazon Q' button is at the bottom.
- What's new:** A section titled 'Updates for features in IAM' with a 'View all' link. It lists a new feature: 'AWS STS now supports validation of select identity provider specific claims from Google, GitHub, CircleCI and OCI'.
- Tools:** A section with a link to 'Tools'.

The bottom of the screenshot shows the Windows taskbar with the date and time '10:13 PM 3/9/2026'.

Activity 5.2 – Attach Policies to IAM Role

After creating the IAM role, required policies are attached to grant necessary permissions. Policies such as Amazon DynamoDB Full Access and Amazon SNS Full Access are added so that the application can read and write data in DynamoDB and send notifications using SNS.

The screenshot shows the AWS IAM console interface. The left sidebar contains navigation links for Identity and Access Management (IAM), Access Management, and Access reports. The main content area displays a list of roles under the heading "Roles (8)".

Role name	Trusted entities	Last activity
AWSServiceRoleForOrganizations	AWS Service: organizations (Service-Linked Role)	460 days ago
AWSServiceRoleForSSO	AWS Service: sso (Service-Linked Role)	-
AWSServiceRoleForSupport	AWS Service: support (Service-Linked Role)	-
AWSServiceRoleForTrustedAdvisor	AWS Service: trustedadvisor (Service-Linked Role)	-
custom_user_role	AWS Service: ec2	20 minutes ago
MEDTRACK	AWS Service: ec2	-
OrganizationAccountAccessRole	Account: 058264256896	3 hours ago
rsoaccount-new	Account: 058264256896	30 minutes ago

At the bottom of the console, there is a "Roles Anywhere" section with a "Manage" button. The footer of the console shows the copyright notice: "© 2026, Amazon Web Services, Inc. or its affiliates." and links for Privacy, Terms, and Cookie preferences.

Epic6: EC2 Instance Setup

Activity 6.1 – Launch EC2 Instance

Amazon EC2 is used to host the MedTrack application on the cloud. In the AWS Management Console, the EC2 service is searched and selected. A new EC2 instance is launched by selecting an appropriate Amazon Machine Image (AMI) and instance type. This instance will run the Flask application and handle user requests.

The screenshot displays the AWS Management Console interface. The browser address bar shows the URL `us-east-1.console.aws.amazon.com/sns/v3/home?region=us-east-1#/subscriptions`. The console header includes the AWS logo, a search bar with the text "ec2", and the account ID "6502-5170-3382". The left sidebar shows the "Amazon SNS" navigation menu. The main content area displays search results for "ec2", including the "EC2" service (Virtual Servers in the Cloud), "EC2 Image Builder", and "Recycle Bin". Below these, there are sections for "Features" and "EC2 Instances" (CloudWatch feature), "EC2 Resource Health" (CloudWatch feature), and "Dashboard". A feedback prompt asks "Were these results helpful?" with "Yes" and "No" buttons. The bottom of the screen shows the Windows taskbar with the date and time "10:15 PM 3/9/2026".

Activity 6.2 – Configure Security Groups and Instance Settings

After launching the EC2 instance, security groups are configured to allow necessary network access. Ports such as SSH (22), HTTP (80), HTTPS (443), and custom application port (5000) are enabled so that the application can be accessed securely and remotely.

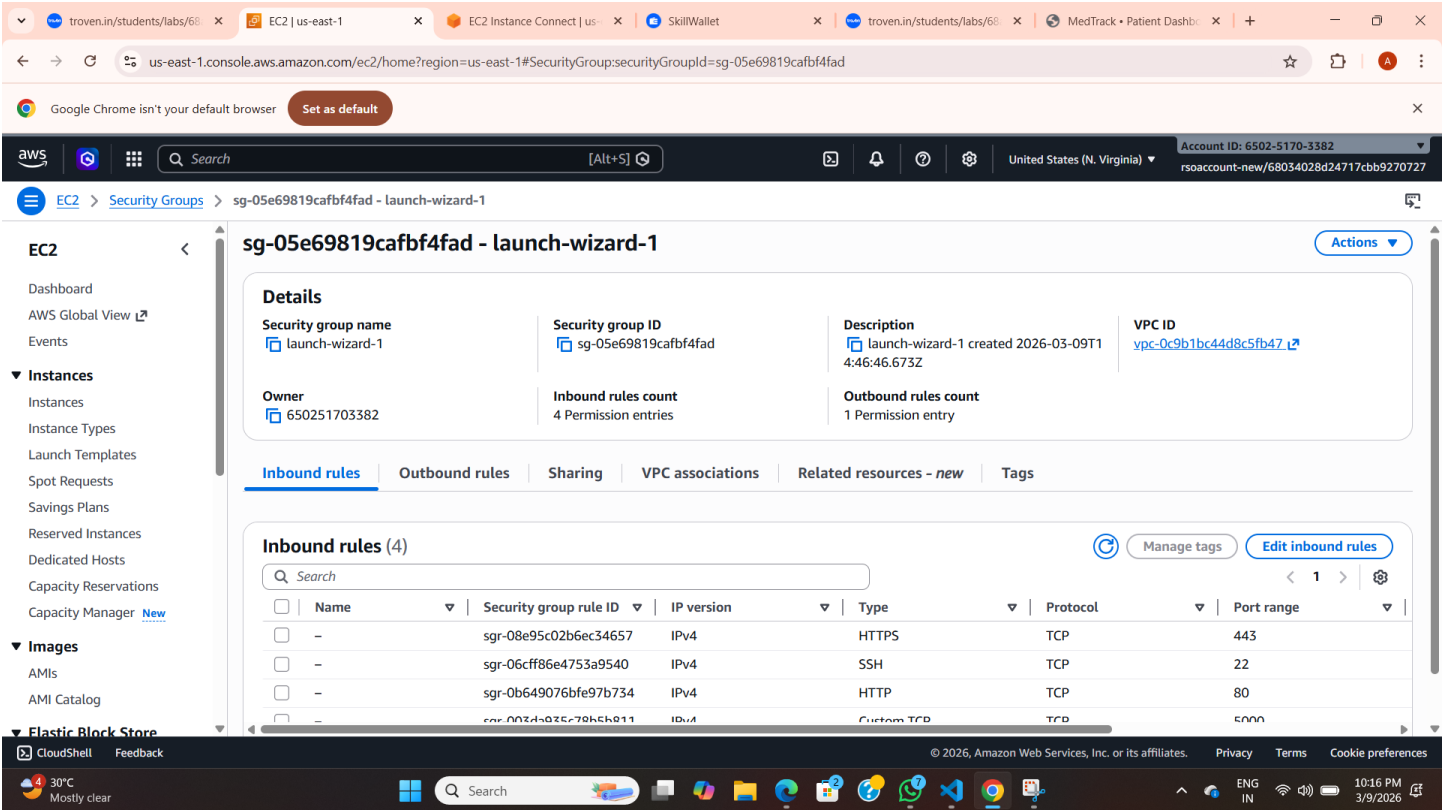

The screenshot displays the AWS Management Console interface for the EC2 Instances page. The instance 'MEDTRACK' (ID: i-0a2be35f87ea6fd99) is shown in a 'Running' state. The instance details section provides the following information:

- Instance ID:** i-0a2be35f87ea6fd99
- Instance type:** t3.micro
- Instance state:** Running
- Public IPv4 address:** 44.221.86.110
- Private IPv4 addresses:** 172.31.75.48
- Public DNS:** ec2-44-221-86-110.compute-1.amazonaws.com

Epic 7: Security Group Configuration

Activity 7.1 – View Security Group Details

After launching the EC2 instance, the security group attached to the instance is checked. Security groups act as virtual firewalls that control inbound and outbound traffic for the EC2 instance. The security group settings are reviewed to ensure the instance can communicate with required services.

The screenshot shows the AWS Management Console for the security group **sg-05e69819cafbf4fad - launch-wizard-1**. The **Inbound rules** tab is selected, displaying a table of 4 rules.

Name	Security group rule ID	IP version	Type	Protocol	Port range
-	sgr-08e95c02b6ec34657	IPv4	HTTPS	TCP	443
-	sgr-06cff86e4753a9540	IPv4	SSH	TCP	22
-	sgr-0b649076bfe97b734	IPv4	HTTP	TCP	80
-	sgr-003d403c79b5b011	IPv4	Custom TCP	TCP	5000

Activity 7.2 – Configure Inbound Rules

Inbound rules are configured in the security group to allow necessary ports for accessing the application. Ports such as SSH (22) for remote access, HTTP (80) and HTTPS (443) for web access, and custom application port (5000) for the Flask application are enabled

Epic 8: Deployment on EC2

Activity 7.1: Install Software on the EC2 Instance

Update and install Python + pip

```
sudo apt update
```

```
sudo apt install python3-pip -y
```

```
sudo apt install git -y
```

```
sudo apt install python3-venv -y
```

```
python3 -m venv venv
```

```
source venv/bin/activate
```

Activity 7.2: Clone Your Flask Project from GitHub

Clone your project repository from GitHub into the EC2 instance using Git.

Run: `git clone https://github.com/adivya140205/MEDTRACK-AWS.git`

Note: change your-github-username and your-repository-name with your credentials

here: `'https://github.com/AlekhyPenubakula/Travel-Booking-website_Ec2_Dynamodb_SNS.git'`

- This will download your project to the EC2 instance.

To navigate to the project directory, run the following command:

```
cd <your-folder>
```

Once inside the project directory, configure and run the Flask application by executing the following command with elevated privileges:

Run the Flask Application

```
export SNS_TOPIC_ARN=arn:aws:sns:ap-south-1:557690616836:BookingConfirmation
```

```
git pull origin main ( Only if you made changes in git and want to reflect them in the EC2 terminal.)
```

Install requirements

```
pip install flask boto3
```

Launch the Flask app:

```
sudo -E venv/bin/python3 app.py
```

Verify the Flask app is running:

<http://your-ec2-public-ip>

- Run the Flask app on the EC2 instance

```

Milestone 8: Testing and Deployment

- **Activity 8.1: Conduct functional testing to verify user registration, login, book requests, and notifications.**

Home Page:

Register Page:

Welcome to MedTrack

Problem: Patients, especially those on multiple medications, often struggle with adherence, leading to missed doses or incorrect timings, impacting health outcomes.

Solution: MedTrack is a secure, cloud-based platform that helps patients track medication schedules, receive reminders, and manage prescription details.

- User login & registration
- Medication entry & dosage tracking
- Custom reminders via SMS/Email (AWS SNS)
- Secure storage using AWS DynamoDB
- Deployed via AWS EC2 & IAM secured

Conclusion:

The MEDTRACK Healthcare Management System has been successfully designed and deployed using a cloud-based architecture on Amazon Web Services (AWS). The system integrates various AWS services such as EC2 for hosting the application, DynamoDB for efficient data storage, SNS for sending email notifications, and IAM for secure access management. By leveraging these cloud services, the platform ensures scalability, reliability, and secure handling of healthcare data.

The application provides an easy-to-use interface where patients can register, log in, and book appointments with doctors. Doctors can view appointment requests, access patient information, and update diagnosis reports. The system improves communication between patients and healthcare providers by providing a centralized platform for managing appointments and medical records.

Using Flask as the backend framework allows the application to efficiently process user requests and manage interactions between the web interface and AWS cloud services. DynamoDB enables fast and reliable storage of user and appointment data, while SNS ensures timely notifications to keep users informed about important system updates.

Overall, the MEDTRACK system demonstrates how cloud computing technologies can be effectively used to develop modern healthcare management solutions. The project highlights the benefits of using scalable cloud infrastructure to build secure, reliable, and user-friendly applications that enhance the efficiency of healthcare service.
